

## Press Release

### Important U.S. Prescribing Information for Caduet

Caduet is a prescription drug that combines 2 medicines, Norvasc and Lipitor. Norvasc is used to treat high blood pressure (hypertension), chest pain (angina), or blocked arteries of the heart (coronary artery disease); Lipitor is used along with diet and exercise to lower high cholesterol. It is also used to lower the risk of heart attack and stroke in people with multiple risk factors for heart disease – such as family history, high blood pressure, age, low HDL-C, or smoking.

Caduet is not for everyone. It is not for those with liver problems. And it is not for women who are nursing, are pregnant or may become pregnant. If you take Caduet, tell your doctor if you feel any new muscle pain or weakness. This could be a sign of rare but serious muscle side effects.

Tell your doctor about all of the medicines you take. This may help avoid serious drug interactions. Your doctor should do blood tests to check your liver function before and during treatment and may adjust your dose. If you have any heart problems, be sure to tell your doctor. The most common side effects are edema, headache, and dizziness. They tend to be mild and often go away. Caduet is one of many options for treating high blood pressure and high cholesterol, in addition to diet and exercise, that you or your doctor can consider.
